

async

The async domain contains methods relevant to the Mapp Response Queue which allows you to stream events via the Mapp Engage API.

This requires some pre-configuration to be done by Mapp first.
If you would like to use this, please get in touch with your Mapp Account Representative.

Available from
v1

In the case of a system with multiple domains, it's possible to receive information about events from a specific domain. In such a situation the feature flag "ResponseQueueService_MultipleDomains" must be active. To receive information about events from a specific domain, necessary is to poll that domain. To receive information about all events necessary is to poll each domain separately.

Be advised that access to saved events will be lost after changing (enabling/disabling) mentioned feature flag.
