

# relatedData updateRecords

## Description

Updates all or specific records for a key in a related data set. For the requests without filter, the behavior is the same as in file import ("delete all + add").

There is no possibility to update the unique RD column. The unique column is treated as a part of the key that's why to change such entities it needs to be deleted and created as the new row.

## Request path

POST [REST URL]/relatedData/updateRecords

## Request Body Type

[RelatedDataRecordAndFilter](#)

## Example body

```
{
  "datasetName":
  "products",
  "key": "testuser@domain.
com",
  "data": [
    {
      "name": "quantity",
      "value":
"14"
    }
  ],
  "filter": [{
    "name": "bicycle",
    "value": "1"
  }]
}
```

Successful response - number of deleted previous occurrences for the specified key. One record was added
